Abstract

One of the problems faced by students of Marine Academy of Banyuwangi is low achievement in reading comprehension. It was shown from their preliminary study, the researcher found that their motivation is low caused by monotonous teaching technique. Therefore, the researcher tried to use small group work to solve the students’ problems in reading comprehension.

From the first cycle, the researcher found that the amount of the students passing the reading test was improving. There were 18 students from 34 students who passed the reading test. However, it did not achieve the criteria of success since the average in the first cycle was still 66.9. In the second cycle, the researcher found that the students’ score was more increasing. The result of the second cycle was 31 students passing the reading test. It means that 91% passing the reading test.

Therefore, it was very clear that small group work could help students to improve their reading comprehension ability.

It allows the reader to convert a written text into a meaningful language with independence, comprehension, and fluency, and to interact with the message. 7 Reading Techniques or Styles are the following: Scanning. Choral reading works best if the teacher directs all students - regardless of age or ability level to use a marker or finger to follow along in the text as they read. Cloze reading is similar to choral reading, except that the teacher does most of the oral reading while the students read along silently. Another method for improving fluency is to have students read aloud to a partner. This procedure works best when students are taught some techniques for giving feedback and managing their time and when the partners have been selected by the teacher [6]. First, students concentrate on pronunciation when they read aloud. Therefore, they cannot concentrate on meaning or be expected to answer comprehension questions after reading aloud. The findings were reached after researchers used computer modelling and biomechanical calculations to work out the dinosaur’s speed, agility and weight. They based their calculations on measurements taken from a fossil dinosaur representative of an average Tyrannosaurus and concluded the creatures probably weighed between six and eight tonnes.
