SMITHSONIAN HERPETOLOGICAL INFORMATION SERVICE

The first number of the SMITHSONIAN HERPETOLOGICAL INFORMATION SERVICE series appeared in 1965. SHIS number 1 was a list of herpetological publications arising from within or through the Smithsonian Institution and its collections entity, the United States National Museum (USNM). The latter exists now as little more than the occasional title for the registration activities of the National Museum of Natural History. No. 1 was prepared and printed by J. A. Peters, then Curator-in-Charge of the Division of Amphibians & Reptiles. The availability of a NASA translation service and assorted indices encouraged him to continue the series and distribute these items on an irregular schedule.

The series continues under that tradition. Specifically, the SHIS series prints and distributes translations, bibliographies, indices, and similar items judged useful to individuals interested in the biology of amphibians and reptiles, and unlikely to be published in the normal technical journals. We wish to encourage individuals to share their bibliographies, translations, etc. with other herpetologists through the SHIS series. If you have such an item, please contact George Zug for its consideration for distribution through the SHIS series. Contributors receive a pdf file for personal distribution.

Single printed copies are available to interested individuals at $5 per issue. Recent issues of SHIS are available as pdf files from our webpage www.mnh.si.edu/rc/. Libraries, herpetological associations, and research laboratories are invited to exchange their publications with us.

Please address all requests for printed copies and inquiries to George Zug, Division of Amphibians and Reptiles, National Museum of Natural History, Smithsonian Institution, PO Box 37012, Washington, D.C. 20013-7012, U.S.A. Please include a self-addressed mailing label with requests.
INTRODUCTION

Sixty-four years after its publication, Robert H. McCauley, Jr.’s *The Reptiles of Maryland and the District of Columbia* remains the only work of great importance in Maryland herpetology. This book, published by the author in 1945, was based on his Ph.D. thesis completed in 1940 at Cornell University. Although McCauley’s thesis bears a curiously modest and misleading title, *A Distributional Study of the Reptiles of Maryland and the District of Columbia*, the thesis is in fact a thorough, 394-page treatment of the biology of the state’s 42 species of turtles, lizards and snakes. It differs in only one significant aspect from the published version: this difference is the omission, in the book, of the locality lists for ten species: *Chelydra serpentina*, *Sternotherus odoratus*, *Chrysemys picta*, *Terrapene carolina*, *Coluber constrictor*, *Elaphe obsoleta* (current name unsettled), *Heterodon contortrix* (= platirhinos), *Natrix (= Nerodia) sipedon*, *Storeria dekayi* and *Thamnophis sirtalis*. Of the two reviews of McCauley’s book that I am aware of (Mansueti 1945; Conant 1946), Mansueti only alludes to this deficiency and Conant makes no mention of it (while making a baseless charge that the book “has a tendency toward verbosity”). McCauley himself gave no specific reason for his decision, except to suggest in the individual accounts that these ten species were widely distributed and thus, one presumes, in little need of documentation. However, for two species, *S. odoratus* and *S. dekayi*, he had relatively few records, including large sections of the state with no documentation. McCauley had somewhat better coverage for *H. contortrix* (= platirhinos); nonetheless, he provided locality lists for other species with roughly the same distribution and number of records. The remaining seven species are indeed widespread in the state; even so, for the sake of completeness McCauley should have listed them.

At the time McCauley was preparing his thesis, the serious study of herpetology in Maryland was nascent and systematic resources were few. Only the National Museum possessed a collection of any consequence, and its collection was largely confined to the District of Columbia and the adjacent suburbs of Montgomery and Prince George’s Counties. As such, McCauley felt compelled to seek records wherever he could find them. Thus during the course of his field work, he examined specimens in the collections of 17 high schools and trusted the reports of several residents he met. Owing to the abundance of voucher specimens and records in permanent collections, a search of secondary educational institutions is unlikely today.

Of the 40 collections that McCauley (1940, 1945) cited (there are slight differences between the two works), only nine are extant and eight of these were well established in McCauley’s time: Academy of Natural Sciences of Philadelphia (ANSP), American Museum of Natural History (AMNH), Carnegie Museum of Natural History (CM), Cornell University (CU), Field Museum of Natural History (FMNH), Museum of Comparative Zoology, Harvard University (MCZ), National Museum of Natural History (USNM), and University of Michigan Museum of Zoology (UMMZ). The remaining collection, that of the Natural History Society of Maryland, was newly formed and apparently uncataloged since McCauley cited no catalogue numbers. Among smaller collections that are no longer in existence but whose specimens (at least some of them) survive, there were seven. The collection of Elias Cohen was largely of living specimens when McCauley saw it (E. Cohen, personal communication), and what was preserved likely went to the Natural History
Society of Maryland. Specimens in Roger Conant’s collection, along with those in the Zoological Society of Philadelphia, which Conant apparently started (listed below as PZS, but ZSP in the book), were dispersed among several collections. So too were specimens from the Rodney Scout Camps, which went to Conant and subsequently were dispersed with his other specimens. The collection of James A. Fowler remained in his possession until 1994, at which time it was deposited in the Carnegie Museum. Francis M. Uhler’s collection was merged into the collection of the United States Biological Survey and subsequently transferred to the National Museum in the late 1980s. The University of Maryland collection was transferred to the National Museum in the late 1950s.

It is beyond the scope of this compilation to account for all the specimens listed below, especially those bearing McCauley’s initials (RHM). Generally McCauley’s voucher specimens, which were divided between Cornell University and the National Museum, bear prefixes [L (lizard), S (snake) or T (turtle)] and his catalogue number. However, in a number of cases only McCauley’s initials appear (I have stated them as “RHM no number”). This condition applies to both the thesis and the book, and McCauley does not provide an explanation. Presumably these specimens were ones that he identified in the field but did not catch, or for unknown reasons chose not to collect (e.g., Terrapene carolina). However, all specimen data in major museums were checked against information provided by those museums. In some cases, errors were identified and corrected. Changes in the names or status of localities and route numbers have also been recorded. Readers should consult McCauley (1940, 1945) for a fuller explanation of the parenthetical data, which consists of data sources and literature cited.

Acknowledgments. I thank Steve W. Gotte, Roy W. McDiarmid and George R. Zug for their assistance.

List of U.S. state reptiles. From Wikipedia, the free encyclopedia. The first state reptile: Oklahoma's common collared lizard. As with other state symbols, states compare admirable aspects of the reptile and of the state, within designating statutes. Before their formal designation as state reptiles, Florida's alligator, Maryland's terrapin, and Texas's horned lizard were all mascots of a major in-state university. Neither of the noncontiguous states, Alaska and Hawaii, have named a state reptile.[82] The District of Columbia lacks a "state" reptile although it does have an official tree and flower (its only animal symbol is a bird).[84] None of the organized territories of the United States have state reptiles, although all four have designated official flowers.[85][86]. Colombia is the sixth richest country in the world for reptiles, and third richest in the Western Hemisphere. The turtles (order: Chelonia or Testudines) number thirty-three species from nine families. Fifteen species are listed as vulnerable, endangered, or critically endangered. Three turtle species are listed as endemic. Fauna of Colombia. "This book is a well-produced and impressive reference to the breeding birds of Maryland and the District of Columbia. It is particularly valuable for illustrating changes in the avifauna of the region during the last 20 years and contains a wealth of information that will be of interest to both amateurs and professionals I highly recommend the 2nd Atlas to anyone with an interest in the birds of the mid-Atlantic seaboard of the USA." (Christopher J. Butler Ibis). "A vital reference for anyone interested in birds or biodiversity conservation in the region." (David Curson The Maryland Colony The Maryland Colony was one of the original 13 colonies located on the Atlantic coast of North America. The original 13 colonies were divided into three geographic areas consisting of the New England, Middle and Southern colonies. The Maryland Colony was classified as one of the Southern Colonies. The Province of Maryland was an English colony in North America that existed from 1633 until 1776, when it joined the other 12 of the 13 colonies in rebellion against Great Britain and became the U.S. state of Maryland.
